Transactions per Product Types

Abstract

- ▶ I conducted a product sales analysis of a fictional coffee shop called Maven Roasters.
- ▶ My analysis focused primarily on the revenue and transactions generated by the coffee shop throughout its day-to-day operations.
- ▶ Since there is no data about the coffee shop's expenses, the scope of my analysis did not include any profit maximization strategies.
- ▶ I used Microsoft Excel to conduct my analysis.
 - ▶ I cleaned the data and added calculated fields using Power Query.
 - ▶ I used Pivot Tables to aggregate the data.
 - ▶ I used Pivot Charts to create a dashboard that summarizes the following information:
 - ▶ Monthly, Weekly, and Hourly trends for revenue and transactions.
 - ▶ Revenue and Transactions per Product Categories.
 - ▶ Revenue and Transactions per Top 9 Product Types.
- ▶ I have uploaded all the files for this project onto my [GitHub](#).

Data-Cleaning Strategy

- ▶ Since I am working with structured data, my data-cleaning strategy was not very involved.
- ▶ I didn't have to create a relational data model for this project because I only had one data table to analyze.
- ▶ I added the following columns to the dataset:
 - ▶ A revenue column
 - ▶ The product of the unit price and transaction quantity columns
 - ▶ A transaction month column
 - ▶ The month name for each transaction date
 - ▶ A transaction day of the week column
 - ▶ The day of week name for each transaction date
 - ▶ A transaction hour column
 - ▶ The hour of the day for each transaction date
- ▶ I changed the unit price and revenue columns to currency data types.

Total Insights

- ▶ Total revenue and transactions show a direct correlation in trends.
 - ▶ Both have increased steadily throughout the year.
 - ▶ Both have remained relatively constant during the week.
 - ▶ Both have increased rapidly from 6 am to 10 am, dropped significantly at 11 am, remained relatively constant from 11 am to 7 pm, then dropped to almost no value at 8 pm.
- ▶ Coffee and tea were the top 2 product categories for revenue and transactions.
 - ▶ Coffee generated \$270K in revenue and had 58,400 transactions.
 - ▶ Tea generated \$196.4K in revenue and had 45,400 transactions.
- ▶ Barista Espresso generated the most revenue for the business.
 - ▶ Barista Espresso generated \$91.4K in revenue.
- ▶ Brewed Chai Tea, Gourmet Brewed Coffee, and Barista Espresso were the top 3 most sold product types.
 - ▶ These three product types had roughly 17,000 transactions.

Store Insights

- ▶ All stores had the same top product categories and types.
- ▶ Stores in Astoria and Lower Manhattan did not follow the same total hourly trends.
 - ▶ Revenue and transactions remained relatively constant, declining slightly from 10 am to 11 am.
 - ▶ For Lower Manhattan, the revenue and transactions followed a similar pattern.
 - ▶ The only difference is that the revenue and transactions dropped to almost no value earlier at 7 pm.
- ▶ Stores in Hell's Kitchen did follow the same total hourly trends, however.

Recommendations

- ▶ There should be a greater emphasis on upselling coffee and tea product categories.
 - ▶ Since these were the top 2 product categories, this strategy will likely boost revenue.
 - ▶ This is to be expected since the business is a coffee shop.
- ▶ There should be a greater emphasis on upselling Brewed Chai Tea, Gourmet Brewed Coffee, and Barista Espresso product types.
 - ▶ Since these were the top 3 product types, this strategy will likely boost revenue as well.
- ▶ Change the operating hours of the coffee shop to increase operational efficiency.
 - ▶ I recommend closing stores at 7 pm because there was an insignificant amount of revenue and transactions across all stores after this time.
 - ▶ This can give employees more free time from work and thus lead to better customer service and employee retention.
- ▶ Maintain the current customer service strategies for revenue maximization.
 - ▶ It appears that these strategies have been effective at increasing revenue month-over-month.
